Resisting Gravity Gracefully

Most women seeking breast procedures range from their mid-20s to mid-40s, with every imaginable background. No two women walk into our office looking exactly the same or wanting the perfect measurements. Drs. Kirbo and Rosenberg's most popular procedures are the breast lift and the breast augmentation, otherwise known as the breast implant (or affectionately as the “boob job”). Many new mothers opt for the breast lift after pregnancy to reverse the effects of breast feeding, or the procedure is chosen by women just hoping to delay Father Time. Breast augmentations are most helpful in increasing size and improving shape.

“When it comes to breast augmentation or breast reconstruction, information is power because knowing all your options will help you make the very best decisions,” said Laurence Rosenberg, MD. “The quality of the breast implant that goes into your body is as important as the skill of the surgeon who puts it there.”

Ben. J. Kirbo, MD, says that safety is a critical factor with any surgery and implants have always received attention in the media. Southeastern Plastic Surgery (SPS) offers patients the FDA-approved MemoryGel™ breast implants, which are among the best implants available. These specific implants have been successfully used and trusted for 20 years by millions of women all over the world. After almost two decades of research and testing with surgeons and patients, MemoryGel™ breast implants are now available to women in the US. These implants feel more like natural breast tissue - without compromising reliability or the safety of patients.

Southeastern Plastic Surgery recognizes that many individuals are seeking customized breast enhancement. The wide variety of Memory Gel™ breast implants allows SPS achieve the best match between the ideal you have been envisioning and your individual body frame.
